ABSTRACT

Content goes here (12, justified)

Note: Entire document should be with 1.5 line spacing and all paragraphs should start with 1 tab space.

ACKNOWLEDGEMENT

We would like to express our sincere gratitude to all those who have supported and guided us throughout the development of our project.

First and foremost, we would like to express our heartfelt thanks to our **Project Mentor, Mr. Anuj Kakran**, for his valuable guidance, continuous support, constructive suggestions and encouragement throughout the project. His guidance helped us to understand the project requirements and complete the work in a systematic manner.

We are deeply grateful to our **Head of the Department, Dr. Sanjeev Tayal**, for his valuable support, encouragement and guidance throughout the project. His support provided us with the motivation and academic environment necessary to successfully complete this work.

We are also thankful to all the **faculty members** for their valuable suggestions, cooperation and academic support during the project.

We would also like to thank our **institution** for providing us with the necessary facilities, resources and learning environment to carry out this project successfully.

Finally, we express our sincere gratitude to our **family and friends** for their constant encouragement, support and motivation throughout the project.

Thank You.

DECLARATION

I hereby declare that the project entitled, "complaint management system' done at [SD COLLEGE OF MANAGEMENTS MUZAFFARNAGAR] has not been in any case duplicated to submit to any other university for the award of any degree. To the best of my knowledge other than me, no one has submitted to any other universiny. The project is done in partial fulfilment of the requirements for the award of degree of BACHELOR OF SCIENCE to be submitted as V semester project as part of our curriculum.

PROJECT SYNOPSIS

COMPLAINT MANAGEMENT SYSTEM

BCA – 5th Semester

---

1. Introduction / Background

The **Complaint Management System** is a web-based application designed to provide an organized and efficient platform for registering, managing, tracking, and resolving complaints. In many organizations and institutions, complaints are still handled manually through registers, emails, or verbal communication. Such methods can be time-consuming, difficult to track, and may result in delayed responses or loss of complaint records.

The proposed Complaint Management System provides a centralized system where users can submit complaints online and administrators can manage them effectively. The system maintains complaint details in a database and allows authorized users to monitor the status of complaints.

The project will be developed using **HTML, CSS, JavaScript, Python, Django, and MySQL**. HTML and CSS will be used for the structure and design of web pages, JavaScript for client-side interaction, Python and Django for the backend, and MySQL for storing and managing data.

The system aims to make the complaint-handling process faster, more transparent, organized, and user-friendly.

---

2. Problem Statement

In a manual complaint management process, users may face difficulties in registering complaints and knowing their current status. Maintaining complaint records manually can also require considerable time and effort.

The major problems in the existing complaint-handling process include:

- Manual registration and maintenance of complaints.
- Difficulty in tracking complaint status.
- Delayed communication between users and administrators.
- Possibility of losing or mismanaging complaint records.
- Difficulty in searching and maintaining old complaints.
- Lack of a centralized database for complaint information.
- Time-consuming complaint management and reporting.

Therefore, there is a need for a computerized system that can manage complaints in an organized and efficient manner.

---

3. Objectives of the Project

The main objectives of the Complaint Management System are:

- To develop a simple and user-friendly web-based complaint management system.
- To allow users to register complaints online.
- To store complaint information securely in a database.
- To allow administrators to view and manage registered complaints.
- To provide complaint status tracking.
- To reduce paperwork and manual record keeping.
- To improve the efficiency of the complaint resolution process.
- To provide quick access to complaint records.
- To maintain centralized and organized complaint data.
- To improve communication between users and the complaint management authority.

---

4. Literature Review / Existing System

In the existing system, complaints are commonly submitted through physical registers, verbal communication, emails, or other manual methods. The responsible person then records and processes the complaint manually.

Manual complaint management has several limitations. It may be difficult to maintain a large number of complaints, search previous records, track complaint status, and generate useful information. Users may also have limited information about the progress of their complaints.

The proposed system improves upon these limitations by providing an online platform for complaint registration and management. It uses a centralized MySQL database and a Django-based backend to manage complaint information efficiently.

---

5. Proposed System / Proposed Solution

The proposed **Complaint Management System** is a web-based application that provides a centralized platform for handling complaints.

The system will provide facilities for users to register complaints by entering the required complaint information. After registration, the complaint will be stored in the MySQL database. The administrator can access the complaints through the Django-based management system and update their status according to the progress of the complaint.

The proposed system will mainly provide:

- User complaint registration.
- Complaint information management.
- Complaint status management.
- Administrator access for managing complaints.
- Database-based storage of complaint records.
- Easy searching and viewing of complaints.
- Organized complaint tracking.
- User-friendly web interface.

The system will help reduce manual work and make the complaint management process more systematic and efficient.

---

6. Methodology

The development of the Complaint Management System will follow a systematic software development approach.

6.1 Requirement Analysis

The requirements of users and administrators will be identified. The required features, data, and system operations will be analyzed.

6.2 System Design

The overall structure of the application, web pages, database, user interface, and system workflow will be designed.

6.3 Front-End Development

HTML will be used to create the structure of web pages. **CSS** will be used for page layout, formatting, and user interface design. **JavaScript** will be used to provide client-side interaction and dynamic functionality.

6.4 Back-End Development

Python with the **Django framework** will be used to develop the server-side functionality of the system. Django will handle application logic, requests, responses, authentication-related functionality, and communication with the database.

6.5 Database Development

MySQL will be used as the database management system. It will store information related to users, complaints, complaint categories, status, and other required records.

6.6 Testing

The system will be tested to identify and correct errors and to ensure that different modules work correctly.

6.7 Implementation

After successful testing, the complete system will be implemented as a web-based Complaint Management System.

---

7. Scope of the Project

The scope of the Complaint Management System includes the development of an online platform for registering and managing complaints.

The system can be used in institutions, organizations, offices, educational environments, and other places where complaints need to be recorded and managed.

The project scope includes:

- Online complaint registration.
- Management of complaint records.
- Complaint status tracking.
- Administrator management of complaints.
- Centralized database storage.
- Easy retrieval of complaint information.
- User-friendly web interface.
- Reduction of paperwork and manual management.

The system can also be enhanced in the future with additional features according to organizational requirements.

---

8. Technologies / Tools Required

The following technologies will be used for developing the Complaint Management System:

HTML

HTML (HyperText Markup Language) will be used to create the basic structure and content of the web pages.

CSS

CSS (Cascading Style Sheets) will be used for designing web pages, layouts, fonts, spacing, and overall presentation.

JavaScript

JavaScript will be used to add client-side interactivity and dynamic functionality to the web application.

Python

Python will be used as the main programming language for developing the backend functionality of the system.

Django

Django is a Python-based web framework that will be used to develop the backend, application logic, URL handling, forms, database interaction, and other web application functionality.

MySQL

MySQL will be used to store and manage the system's data, including complaint records and other required information.

---

9. Expected Outcomes

The expected outcome of this project is a functional and user-friendly **Complaint Management System** that provides an efficient method for registering, managing, and tracking complaints.

The system is expected to:

- Reduce manual complaint management.
- Provide faster complaint registration.
- Maintain organized complaint records.
- Make complaint tracking easier.
- Improve the efficiency of complaint handling.
- Provide centralized database storage.
- Reduce paperwork.
- Allow administrators to manage complaints efficiently.
- Provide a simple and accessible web interface.
- Improve the overall complaint resolution management process.

The project will demonstrate the practical application of **HTML, CSS, JavaScript, Python, Django, and MySQL** in developing a real-world web-based application.
